## VelaSmooth

# FAQS

### **What is the VelaSmooth?**

VelaSmooth is a new device to treat the appearance of cellulite. It is based on the now well-established Elos technology and utilises a combination of three modalities – controlled fixed wavelength Infra Red Light, Vacuum Suction and conducted Bipolar Electrical energy.

### **What is Elos?**

Elos stands for electro optical synergy and combines bipolar conducted electric current with optical energy.

### **Is treatment with Elos technology safe?**

Treatment is safe for the skin when used in accordance with the manufacturer's guidelines. There are many advances in the new Elos technology that make it one of the safest systems available for all skin colours. There are no known long-term health hazards – both light and electric energy have safely been used for decades in medicine, surgery, and aesthetics. Note: The patient's personal physician should always be consulted before treatment.

### **How does VelaSmooth help the appearance of cellulite?**

The lumpy dimpled appearance of cellulite is predominantly caused by fibrous bonds constricting and holding fatty deposits. The VelaSmooth device mechanically manipulates these fibrous bonds, skin and the fat layer and simultaneously provides consistent effective heating to subcutaneous fat whilst also increasing stimulation to mitochondria. Bonds are stretched, cells are lysed (broken down) and absorbed, metabolism of the area is increased and the end result is a smoother, more regular appearance and a general reduction in hip size.
